Fast Requests

Speed Kit
Cloud

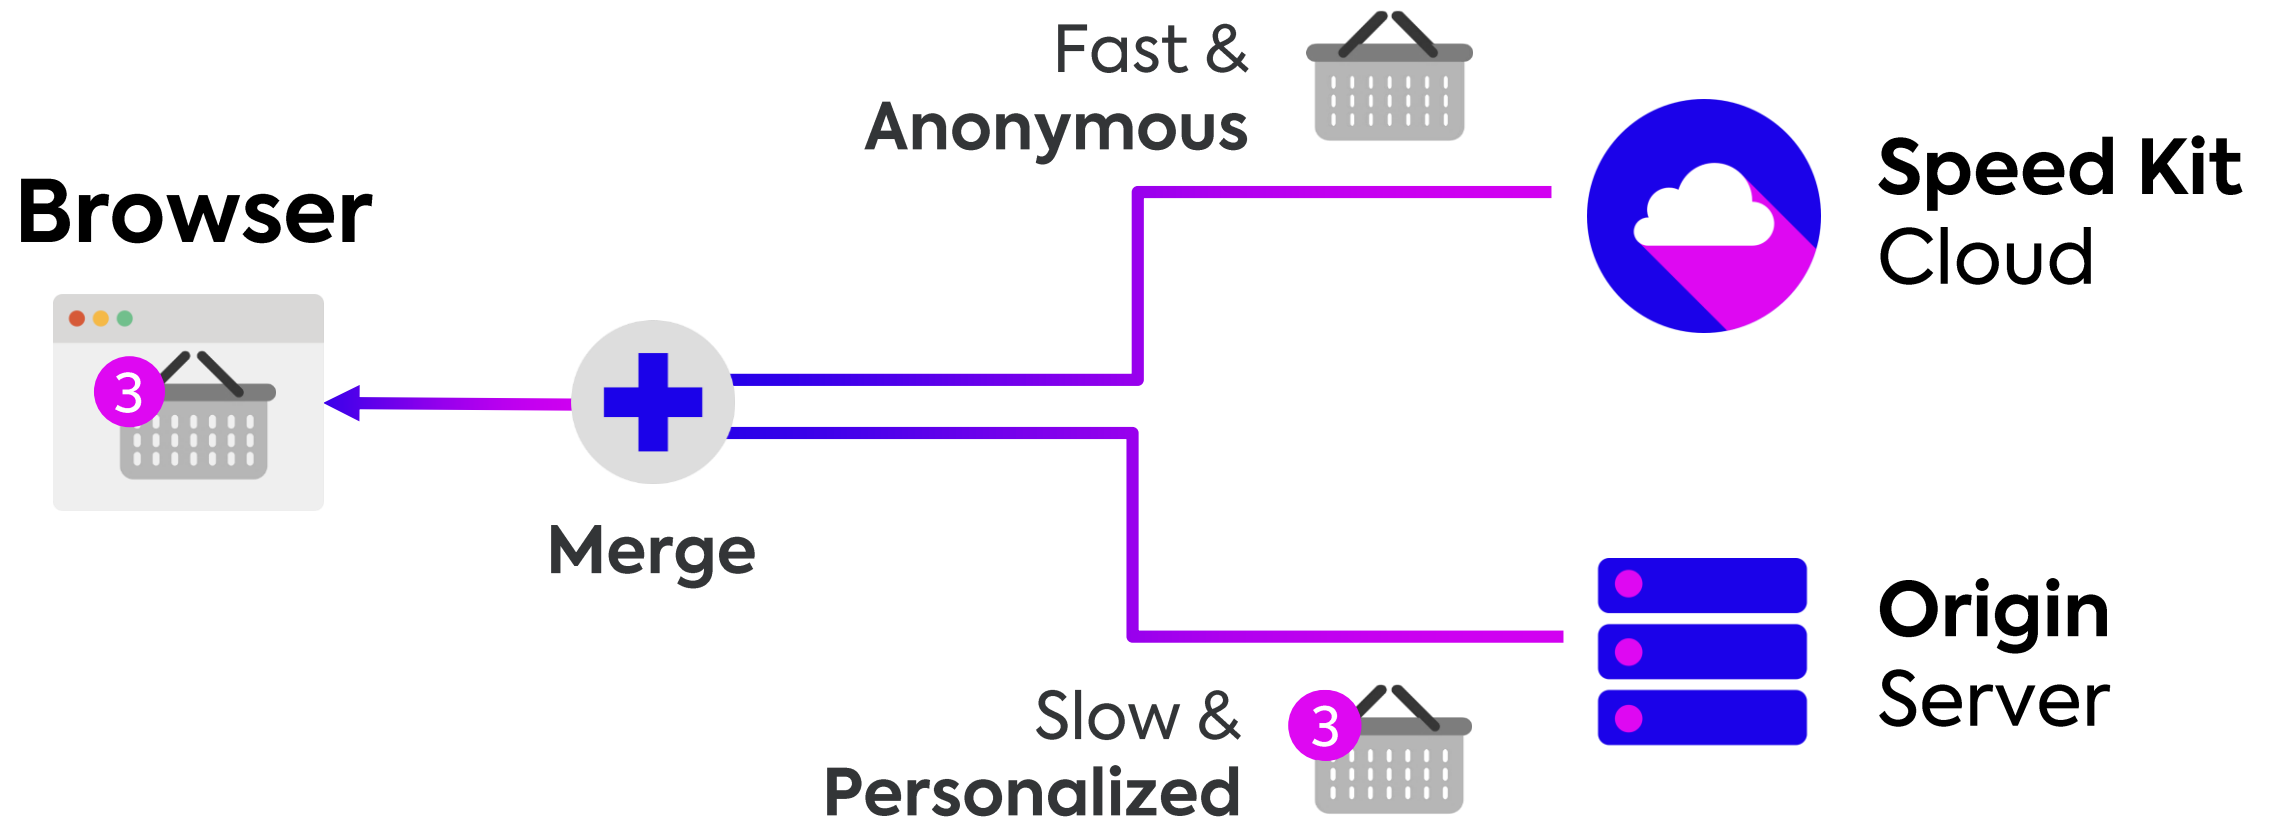

Tracking & Ad
Services

Real-Time Sync

Origin
Server

Accelerating **Personalized HTML**

Split Testing for Web Performance

Speed Kit Users

- Speed Kit enabled

vs.

Normal Users

Tracking

Tracking

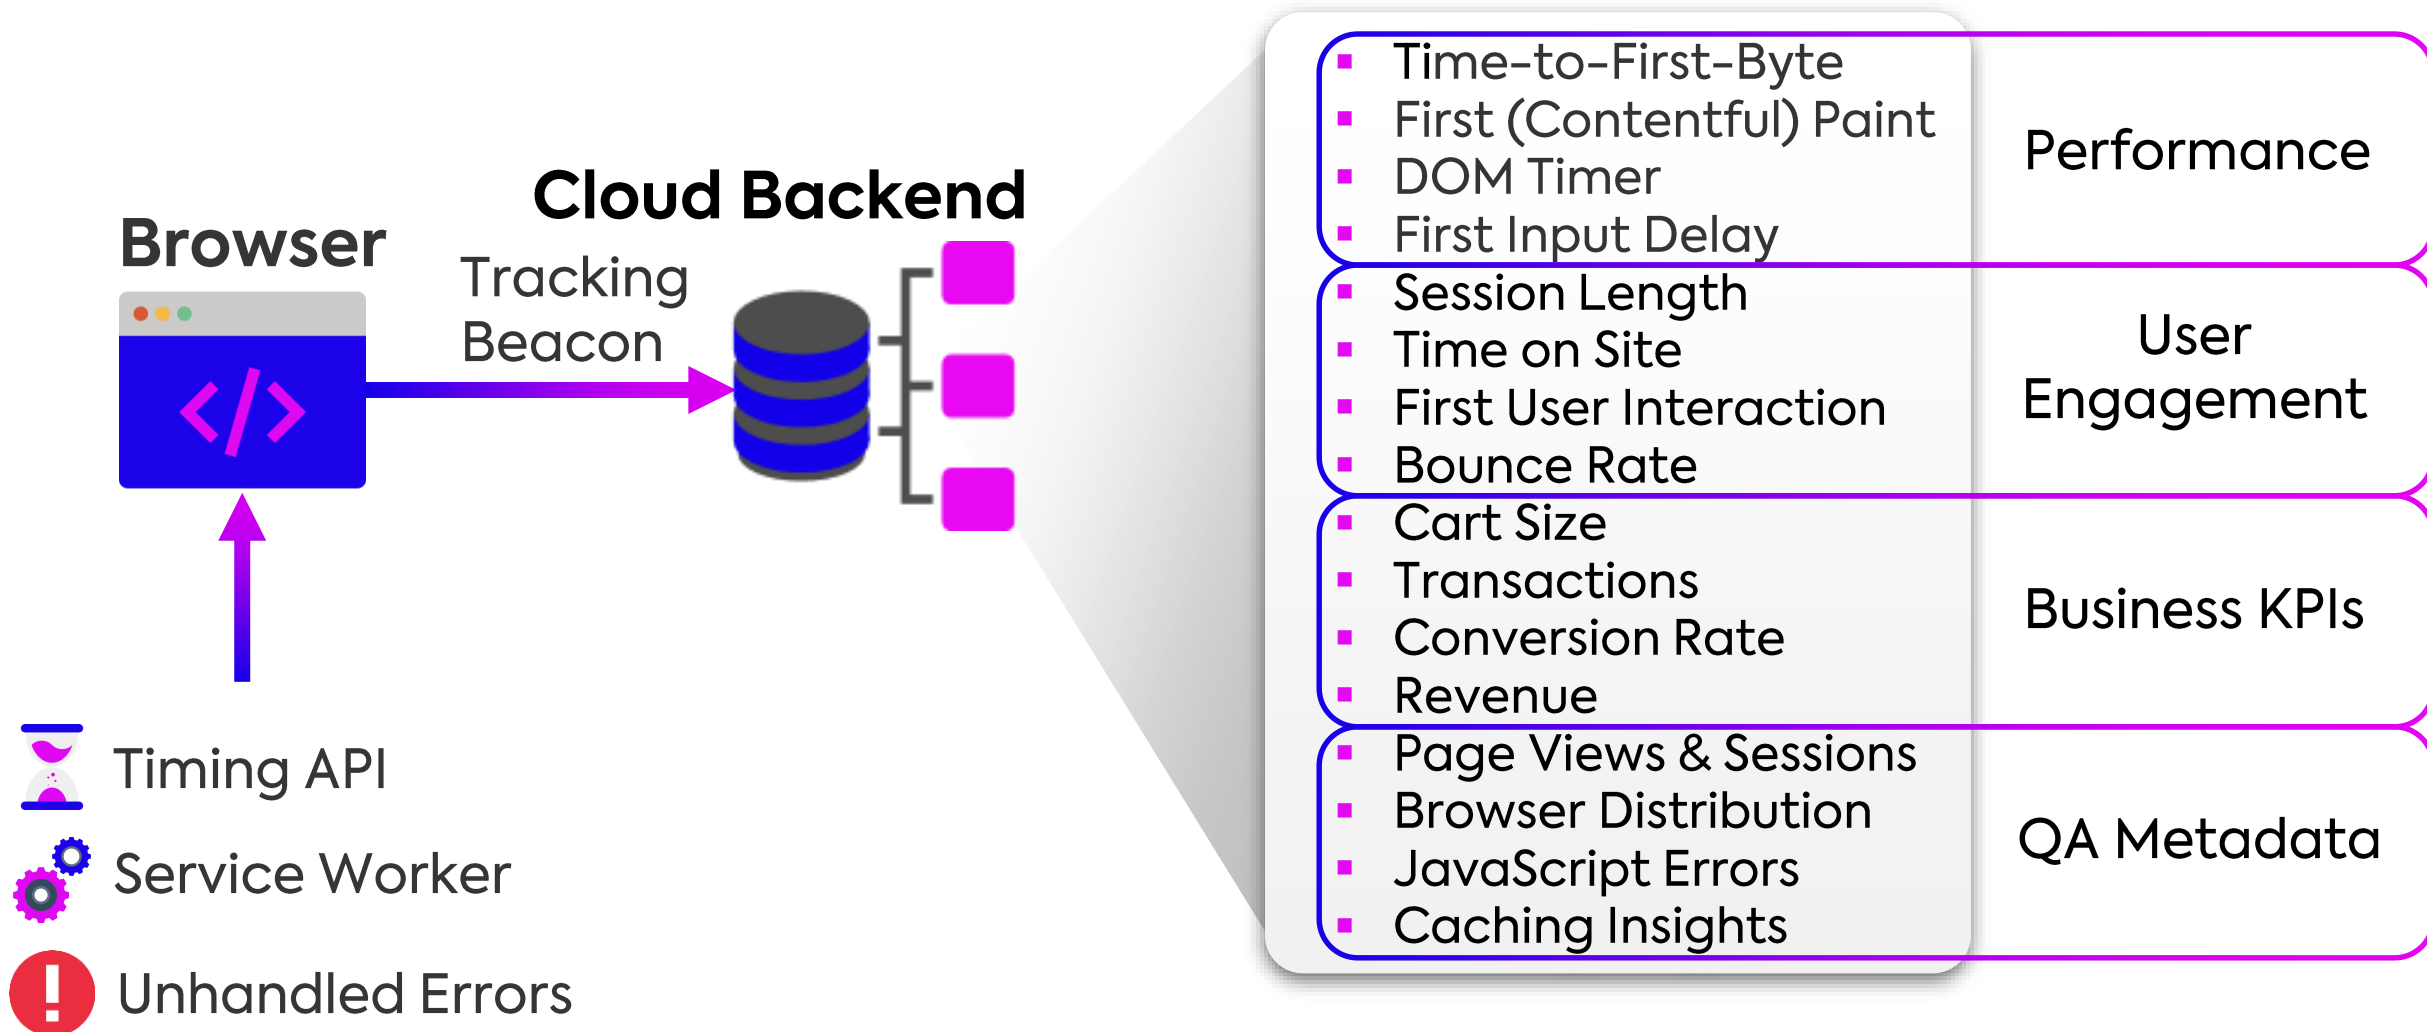

**Kino 7
Friday, 11:00**

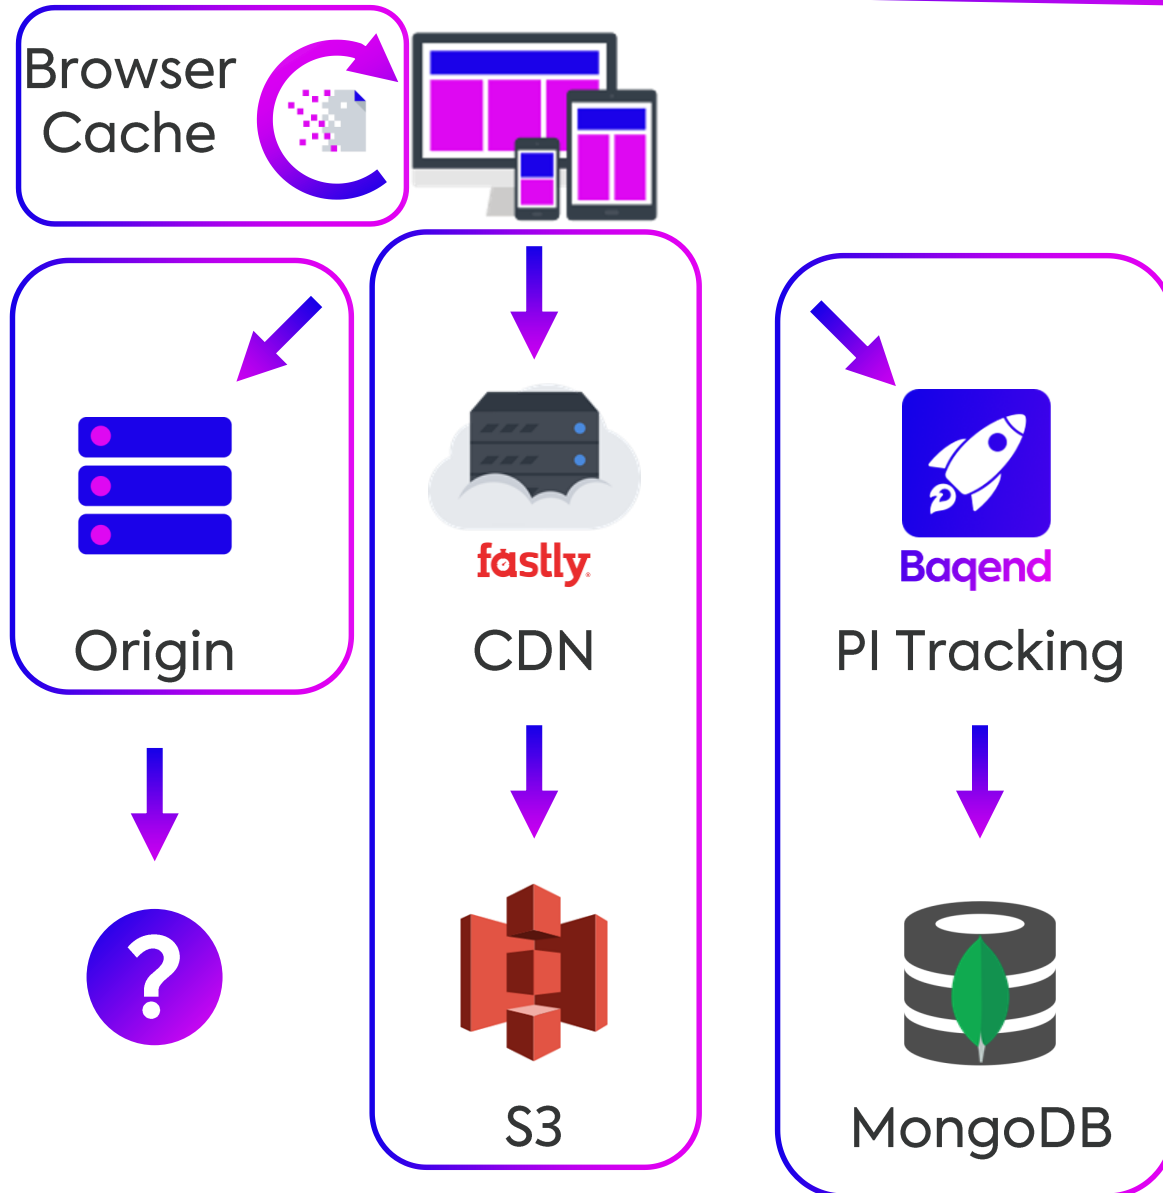

- **Measurable uplift:**
 - + Performance
 - + User engagement
 - + Business success

- Speed Kit disabled
(no acceleration)

Goal: Performance & Business Insights

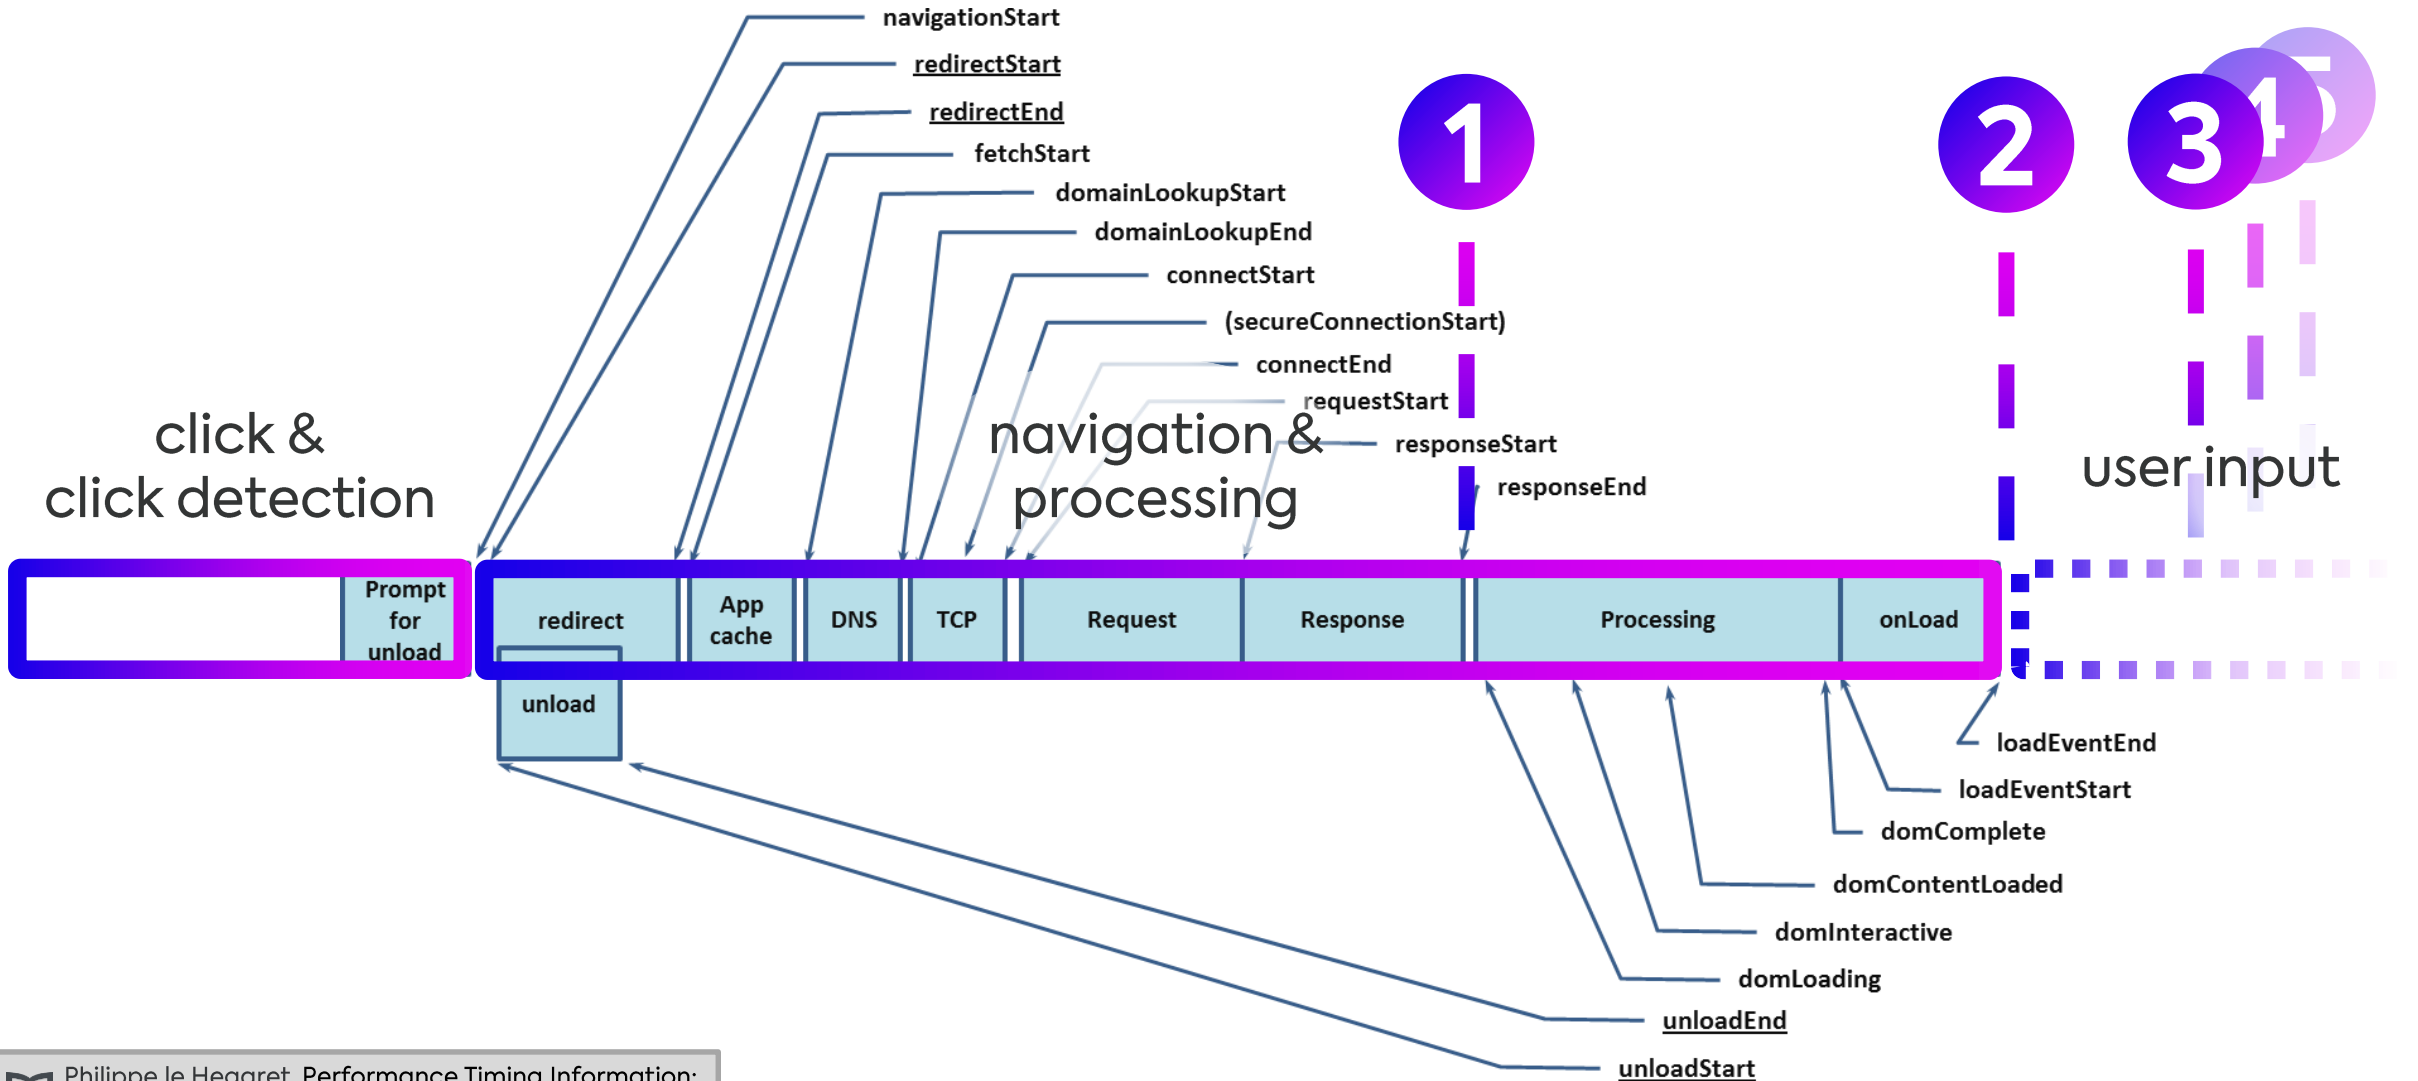

How to **Monitor** Performance?

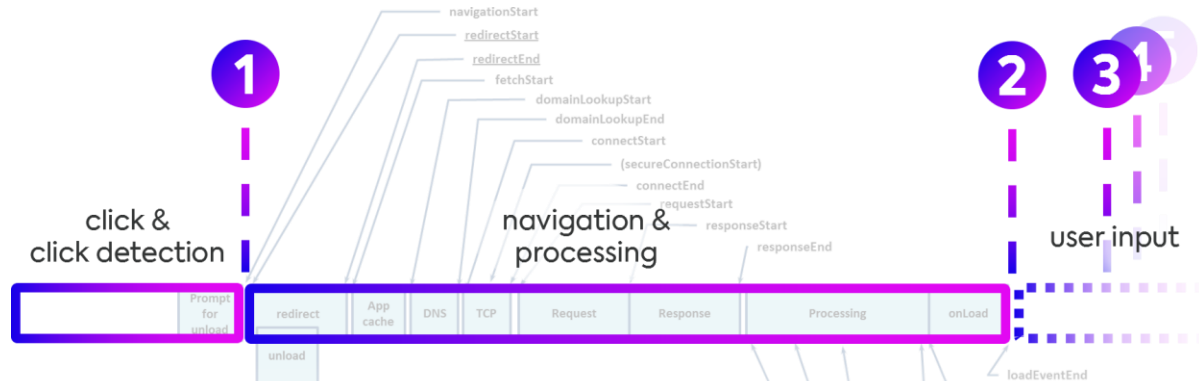

- Logging requests is not enough:
 - ✗ User? Rendering? ...
 - ✗ Browser cache (invisible)
 - ✗ Origin requests (no logs)
 - ✓ CDN requests
- Solution: **Tracking every PI** (page impression)

When to Send Data Beacons?

Types of Data Beacons

1. 1 for **static** info
(URL, user agent, session ID, ...)

2. 1 for **timings**
(TTFB, load time, FCP, ...)

3. 0-n for **custom** events
(first input, add-to-cart, ...)

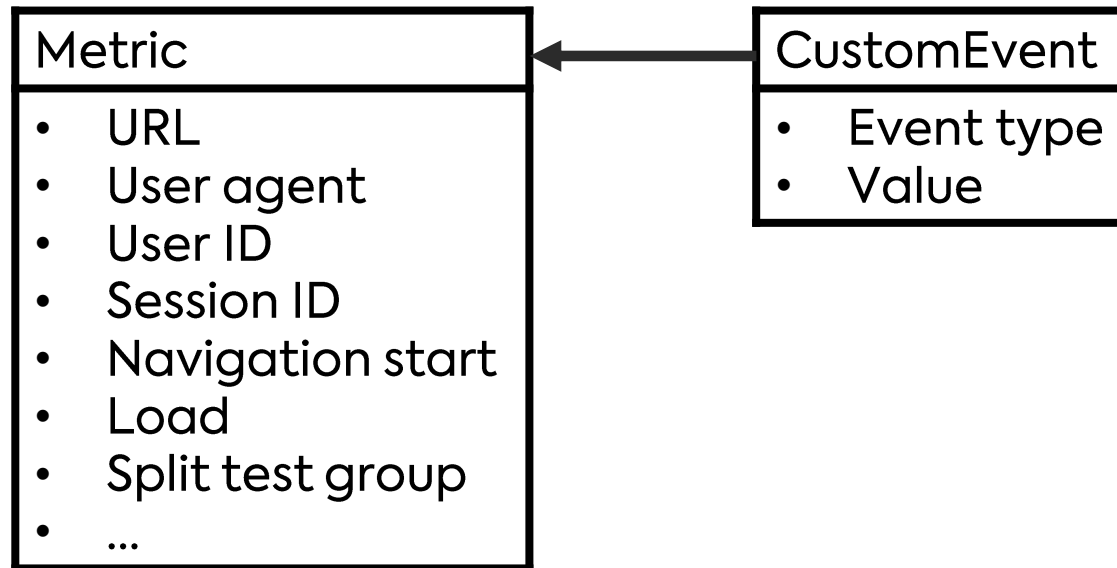

Metric Beacon

CustomEvent Beacon

A person's hands are shown using a Tektronix TDS 3034B oscilloscope. The oscilloscope screen displays two waveforms: a noisy signal and a clean sine wave. To the left of the oscilloscope is a color calibration chart with various colored bars. The person is holding a probe connected to the oscilloscope. The entire image has a purple tint.

Let's Analyze the Data

Tracking Data in MongoDB

- Debugging with OLTP **queries**
- Analyses with **aggregation pipeline**, e.g.:
 - Average session length
 - Uplift vs. Acceleration
(example: Conversion rate vs. first paint uplift)
 - Different browser timings by device/browser/...

CDN Logs in S3

- Automation via Jenkins jobs
- **Caching-related** statistics, e.g.:
 - Request latency distribution (histogram)
 - Image optimization efficiency

Problems I: CDN Data Import

1. **Partitioning** by hour, but not by customer

→ Not scalable!

2. **Indexing & database import:**

a) Import into indexed table

b) Drop index → import → create index

c) Query table without index

} each takes forever

Problems II: Aggregation Pipeline

Indexing

Queries over non-indexed attributes were infeasible

Runtime

Even with indexes in place, queries could take 30+ min.

Scalability

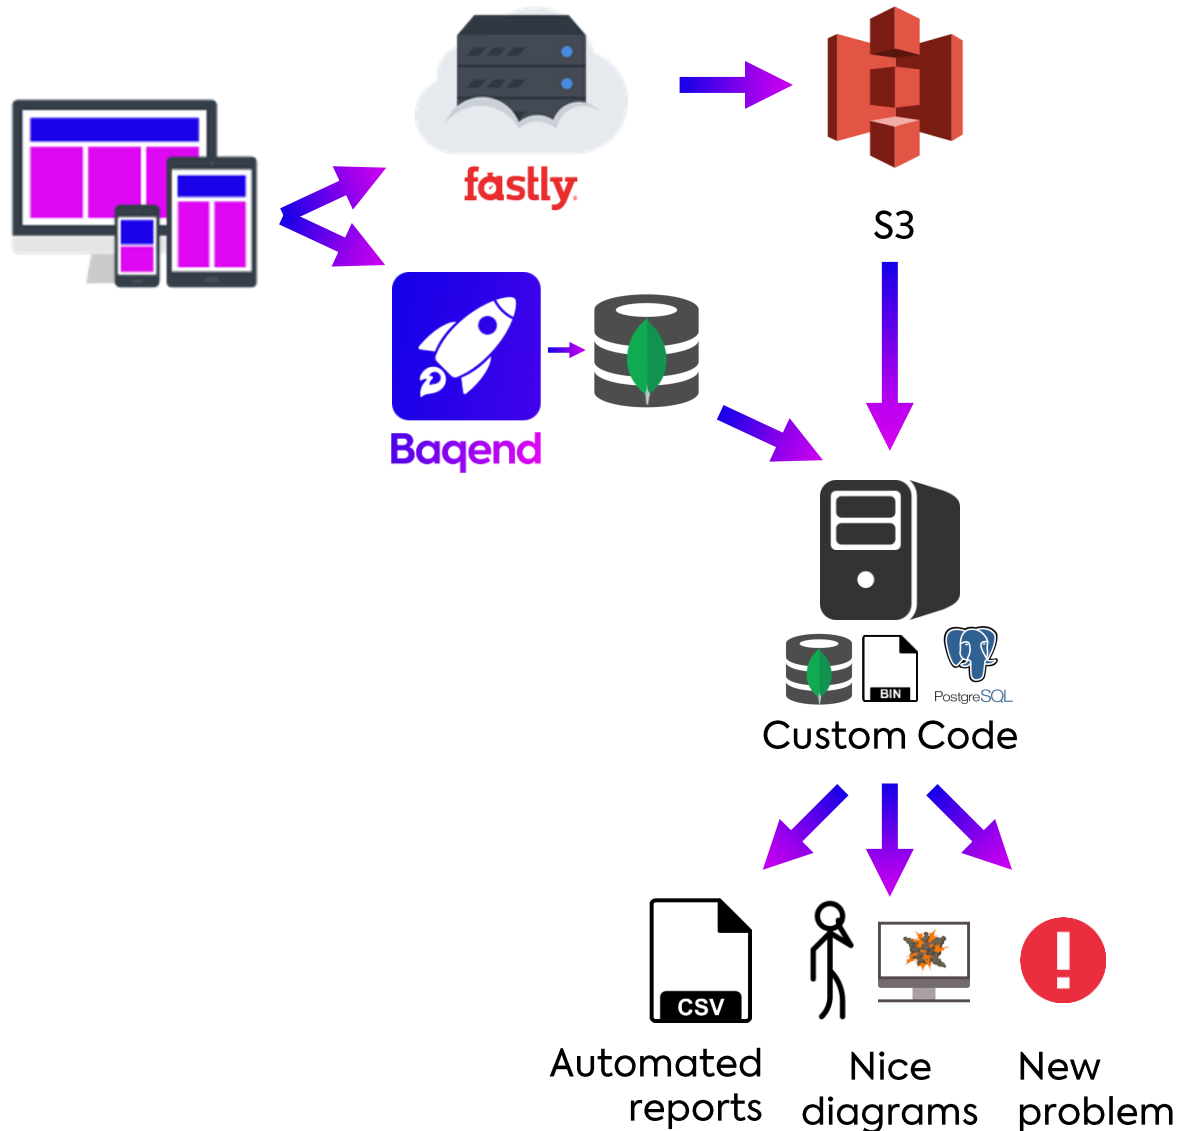

Queries got slower with increasing amounts of data

Complexity

MongoDB aggregation pipelines become sophisticated quickly

Problems III: Reporting

- Scheduling:
 1. On-demand
 2. Periodic job
- Problems:
 - Cumbersome to build & maintain
 - Awkward to extend
 - Unreliable

Problems IV: Joins in MongoDB

✗ **Joins infeasible** for data-intensive queries!

- No conversion analysis
- No business uplift validation
- **Not acceptable!**

Fixing My Life With ~~Flex Tape~~ Athena

The „A“ Stands for „**AWS**ome“

- Desperate **attempt**:
 1. Dump MongoDB collection
 2. Upload to S3
 3. Query with Athena

- Typical analysis:
 - 1 equi-join
 - 3 mio. Pls
 - ~15+ min.

The „A“ Stands for „**AWS**ome“

~~Desperate attempt~~: New best practice:

1. Dump MongoDB collection
2. Upload to S3
3. Query with Athena

AWS
Athena

- Typical analysis:
 - 1 equi-join
 - 3 mio. Pls
 - ~10 seconds

What's an Athena?

Athena

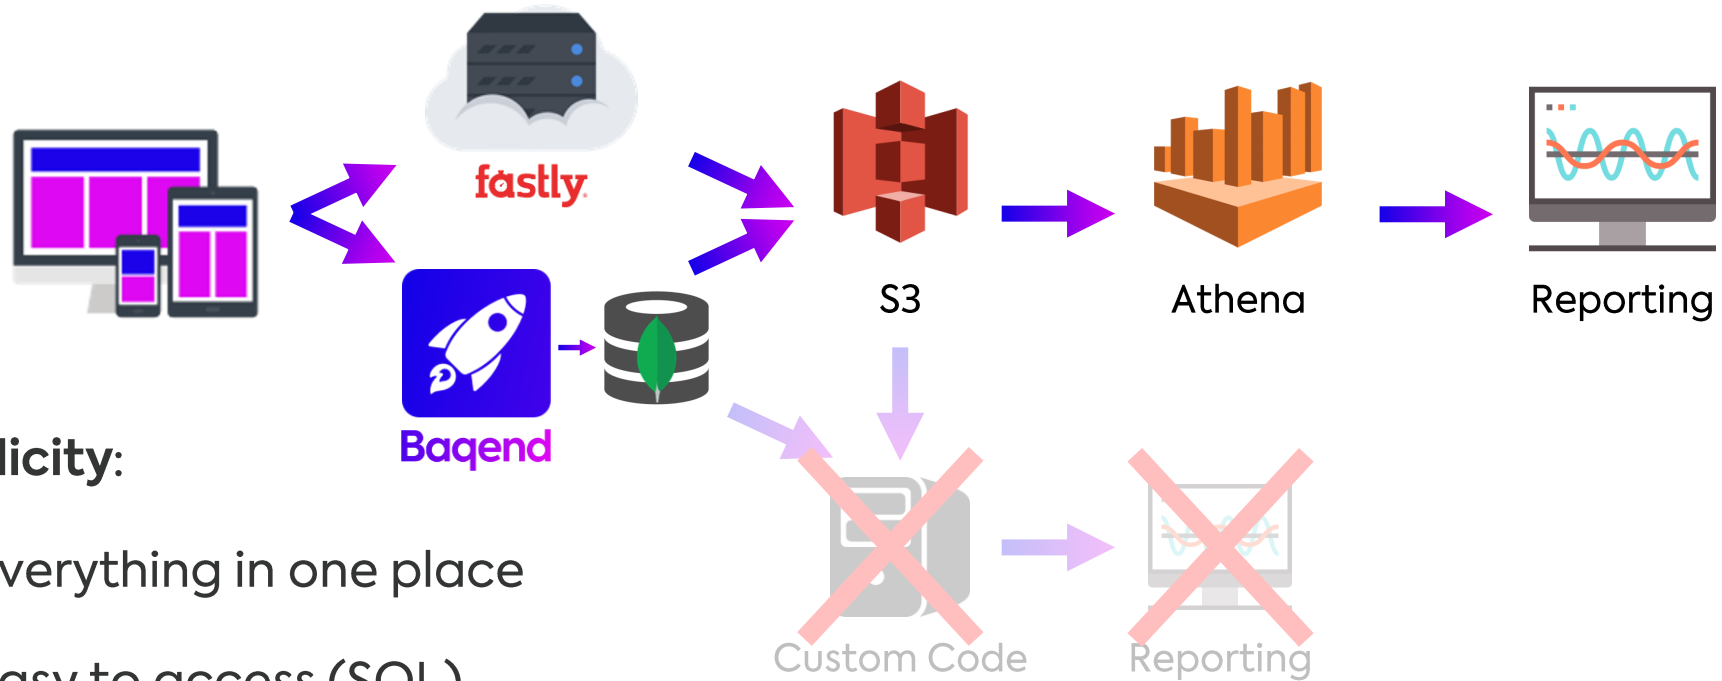

=

presto 

- **Managed Presto:**
 - Interactive analytics with SQL
 - Heterogeneous datastores
 - Petabyte-scale (Facebook)
- **Pricing** by scanned data volume:
 - ➔ Efficient storage formats!
 - ➔ Partitioning or clustering!
 - ➔ Careful query design!

Upgrading Our ETL Pipeline

- **Simplicity:**
 - Everything in one place
 - Easy to access (SQL)
- **Scalability & efficiency:**
 - Hundreds of gigabytes scanned in a query
 - Response time on the order of seconds

Processing Stages & Latency

Alerting

Processing Stages

Trend Analysis

- Simple metrics
 - Counters
 - Extreme values
 - Specific errors

- Complex aggregations
 - Conversion rate
 - Performance by day
 - Seasonal effects

Stage 0: Data Preparation

```
{
  "_id": "ABC",
  "loadEvent": {
    "$numberLong": "1571101211368"
  },
  "createdAt": {
    "$date": "2019-10-15T01:00:11.462Z"
  },
  ...
}
```

_id	loadEvent	createdAt	...
ABC	Oct. 15, 2019 1h 0m 11s 368ms	Oct. 15, 2019 1h 0m 11s 462ms	...
...

- Schema Definition
 1. **Tables** for raw data
 2. **Views** on top to hide artifacts

Example: Timestamps

```
FROM_UNIXTIME (  
    CAST (  
        CAST (  
            JSON_EXTRACT(loadEventEndRaw, '$["$numberlong"]')  
            AS VARCHAR)  
        AS DECIMAL (38,3)) / 1000  
    ) AS loadEventEnd
```

1. Extract UNIX timestamp from JSON
2. Cast to varchar
3. Cast to decimal
4. Divide by 1000
5. Convert to timestamp

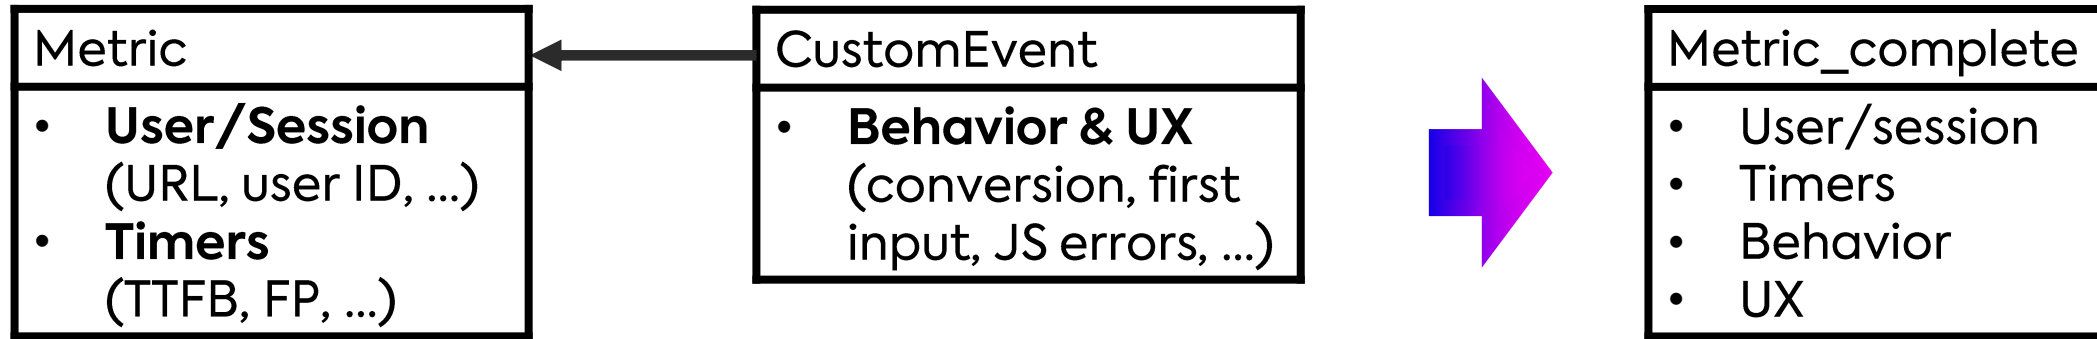

Example: Timestamps

```
CASE WHEN
  CAST (
    CAST (
      JSON_EXTRACT(loadEventEndRaw, '$["$numberlong"]')
    AS VARCHAR)
  AS DECIMAL (38,3)) > 0
THEN
  FROM_UNIXTIME (
    CAST (
      CAST (
        JSON_EXTRACT(loadEventEndRaw, '$["$numberlong"]')
      AS VARCHAR)
    AS DECIMAL (38,3)) / 1000
  )
END AS loadEventEnd
```

Note: still a timestamp
(no timing in ms)

1. Extract UNIX timestamp from JSON
2. Cast to varchar
3. Cast to decimal
4. Divide by 1000
5. Filter out rubbish
6. Convert to timestamp

Stage 1: **Join** Beacons

- Consolidate PI data into **single rows**
- Data **cleaning**
(e.g. nullify when `loadEnd < navigationStart`)

Stage 2: Resolve User Agents

Metric_complete
• User agent
• ...

WhatIsMyBrowser.com

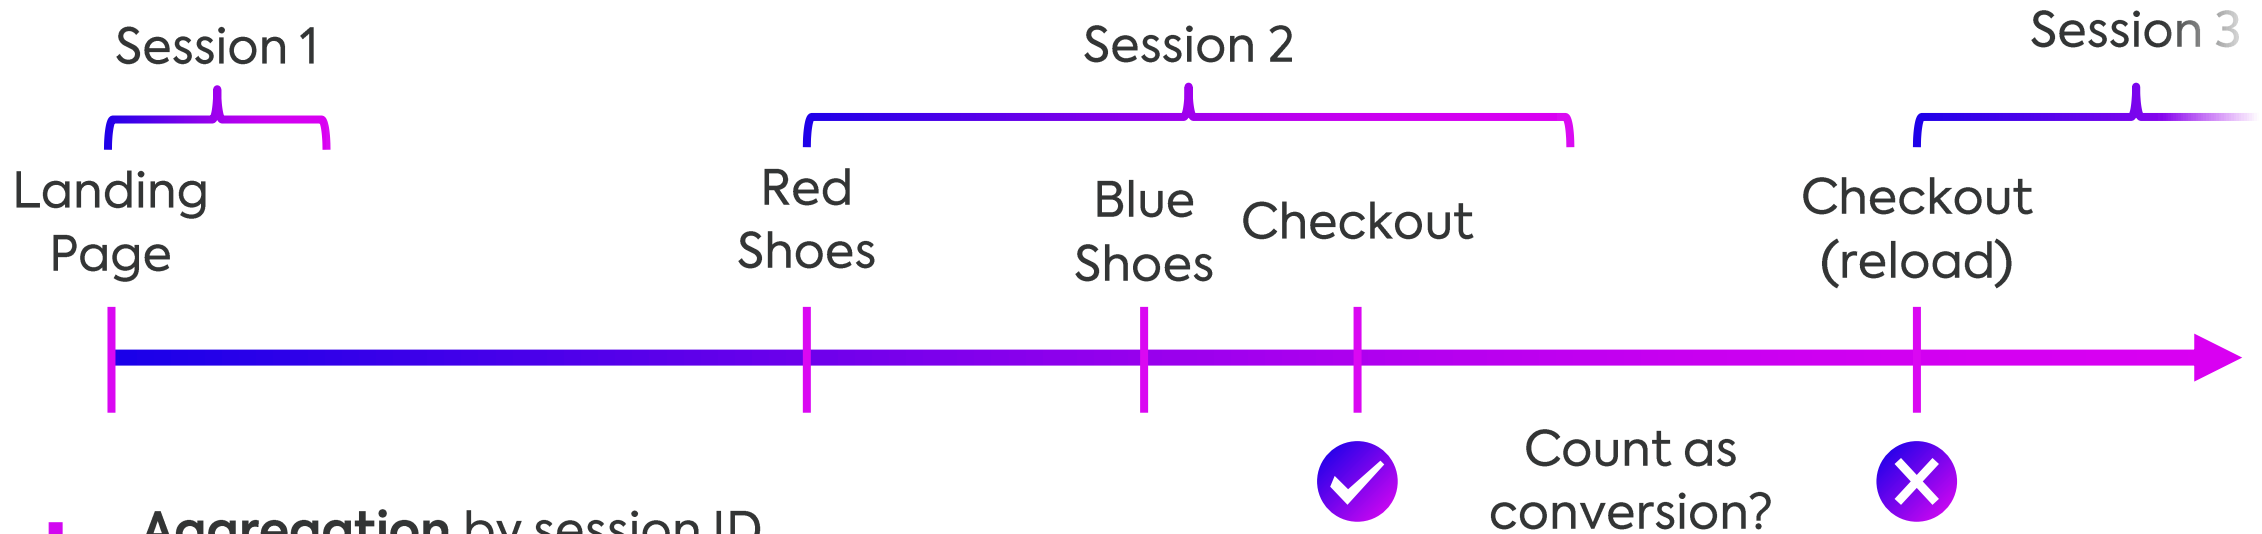

Metric_complete
• browser (+ version)
• Device type
• Device
• OS (+ version)
• ...

- **Paid service:** interpreting user agents is complex!
- **Fallback:** simple `case-when` logic for browsers and device type
- **Simplification** required, e.g.:
 - Device: `mobile/desktop/tablet/server/game console/wearable/vehicle/...`
 - Browser: `Chrome/Firefox/Safari/Opera/IE/Netscape/Tesla Browser/...`

Stage 3: Session Metrics

- **Aggregation** by session ID
 - Session length, bounces
 - Time on site
 - Performance (e.g. median FCP)
 - Conversions

Stage 4: **Materialized** Views

Business uplift during
Proof of Concept (PoC)

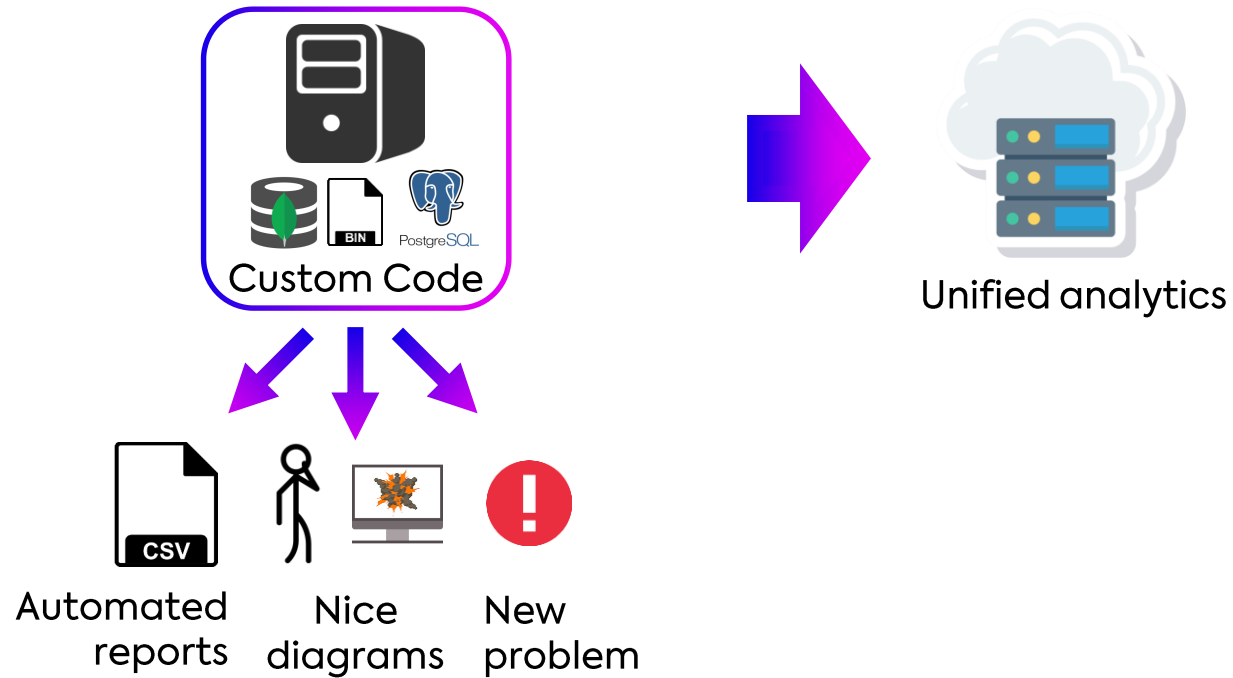

Aggregation over days
or weeks

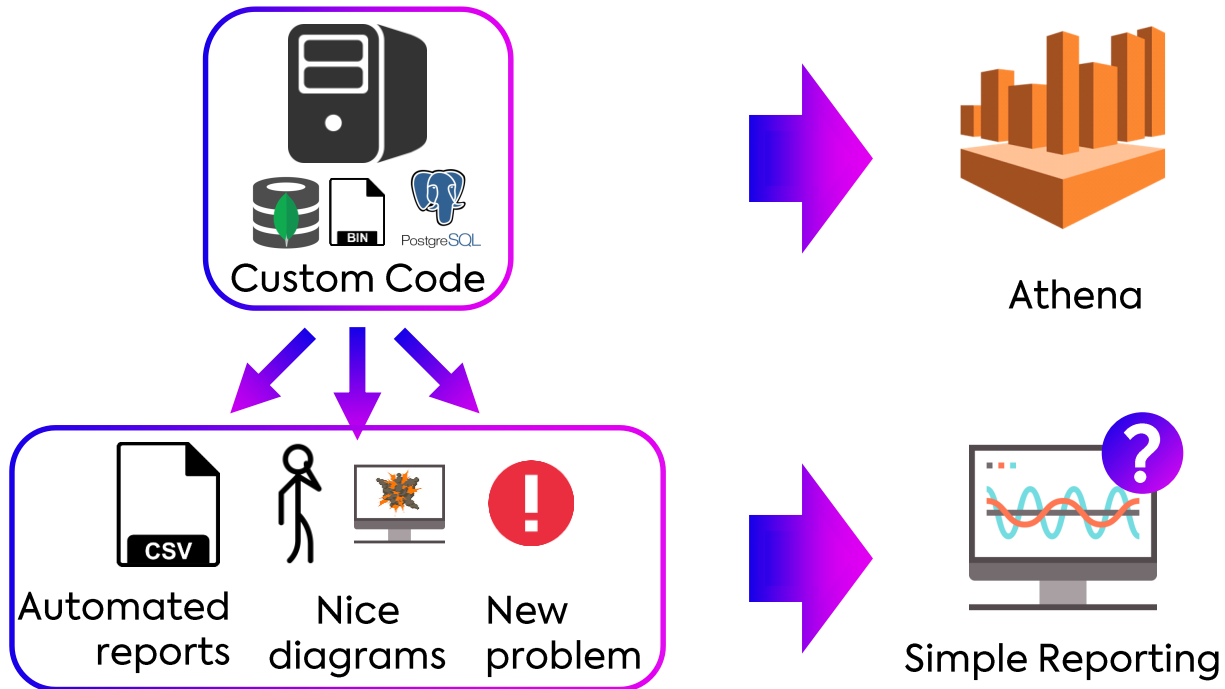

Performance and
business trend analysis

Reporting: The Right Tool for the Job

Reporting: The Right Tool for the Job

- **Requirements:**
 - Automation
 - Easy data exploration
 - Robustness

Why QuickSight?

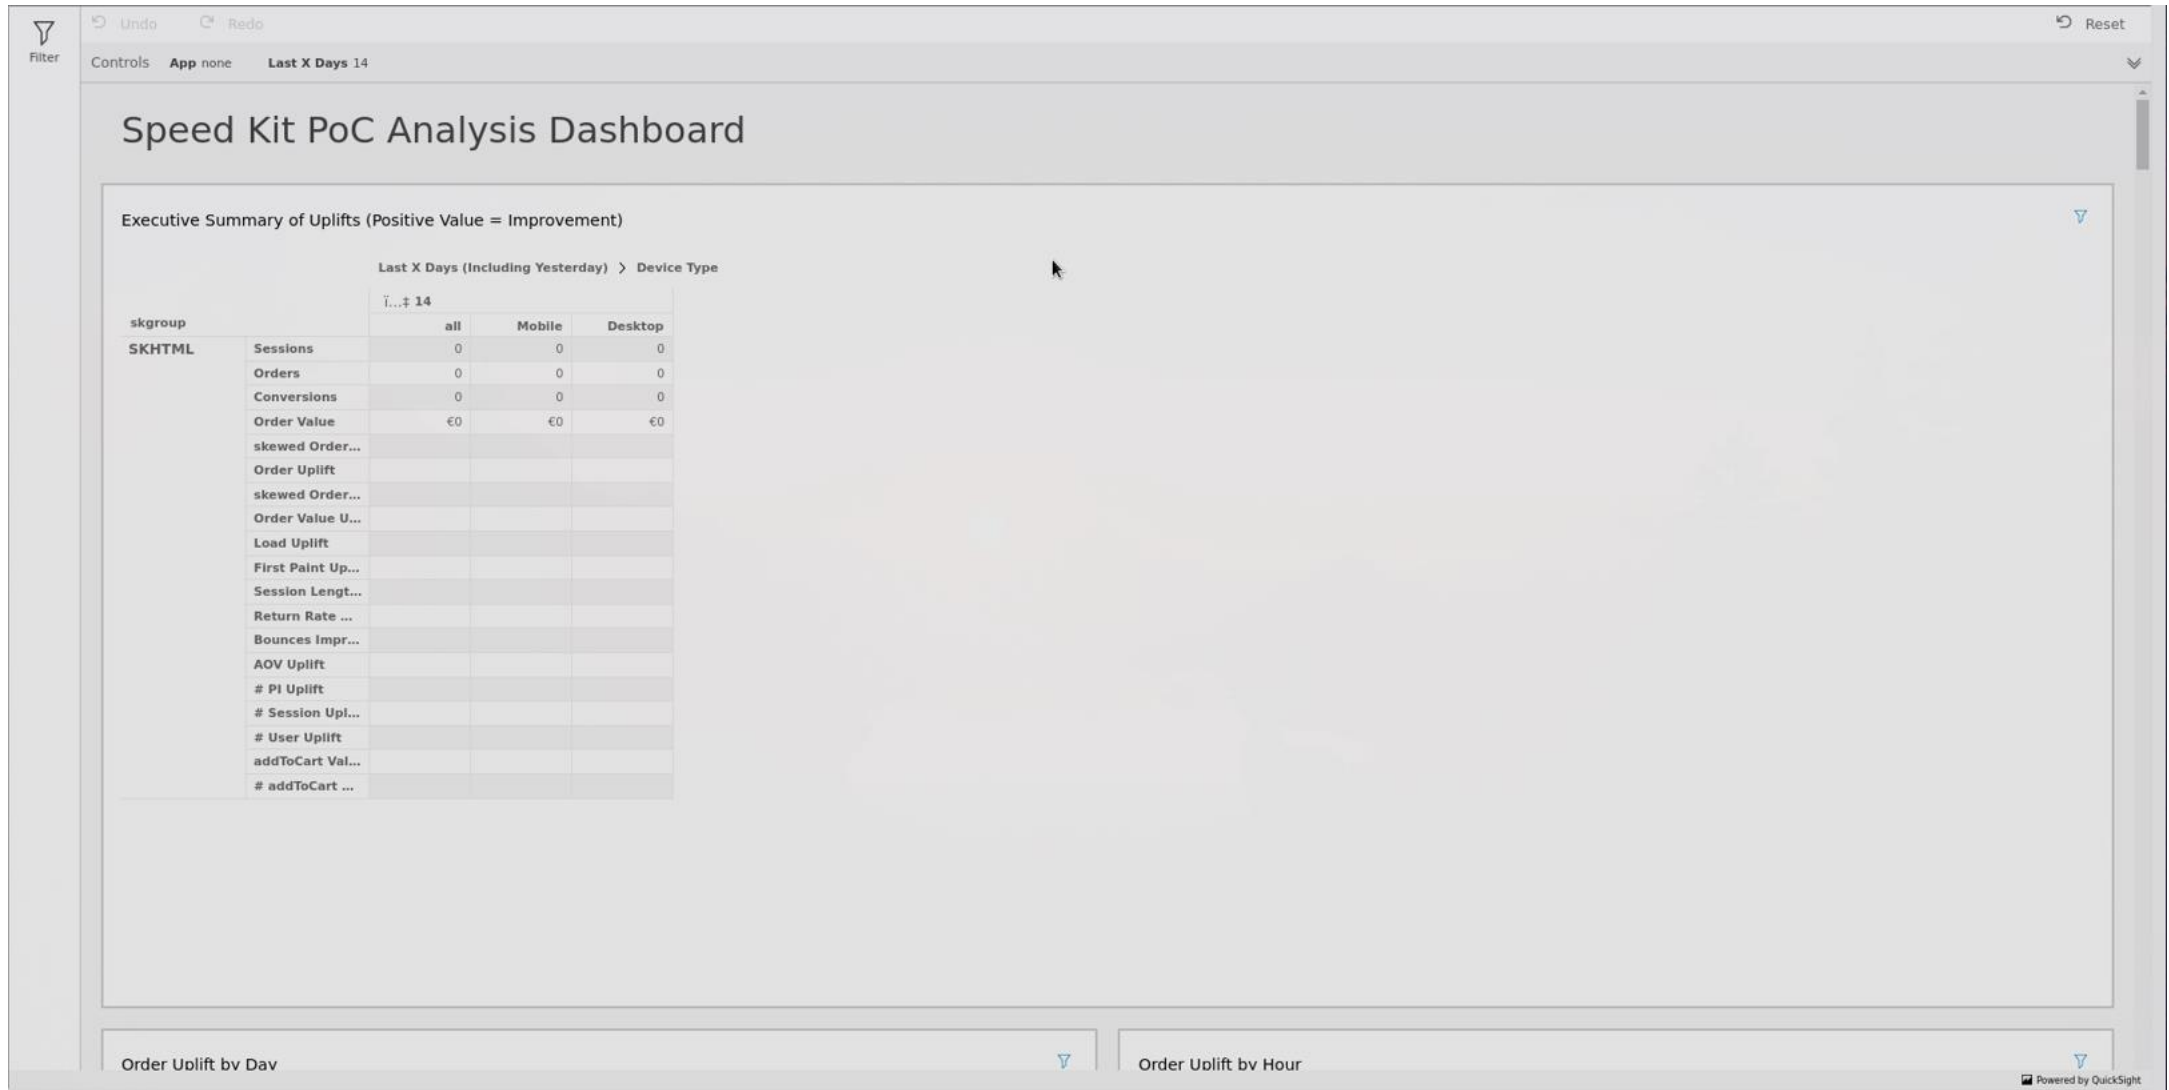

- ✓ Easy integration with Athena
- ✓ Ease-of-use
- ✓ Quick results

A photograph of a person tripping over a banana peel on a sidewalk. The person is wearing a black shirt, red shorts, and blue sneakers. They are in a falling position, with one leg bent and the other extended. A banana peel is on the ground near their foot. The background is a textured concrete sidewalk. The entire image has a purple color overlay.

N/A

Succeeded

55.97

42.82 GB

But There is **More**!

Questionable Limits

Diagrams in the dashboard, query timeouts, etc.

Exhausted Resources in Athena

Queries fail depending on time, day, and weather

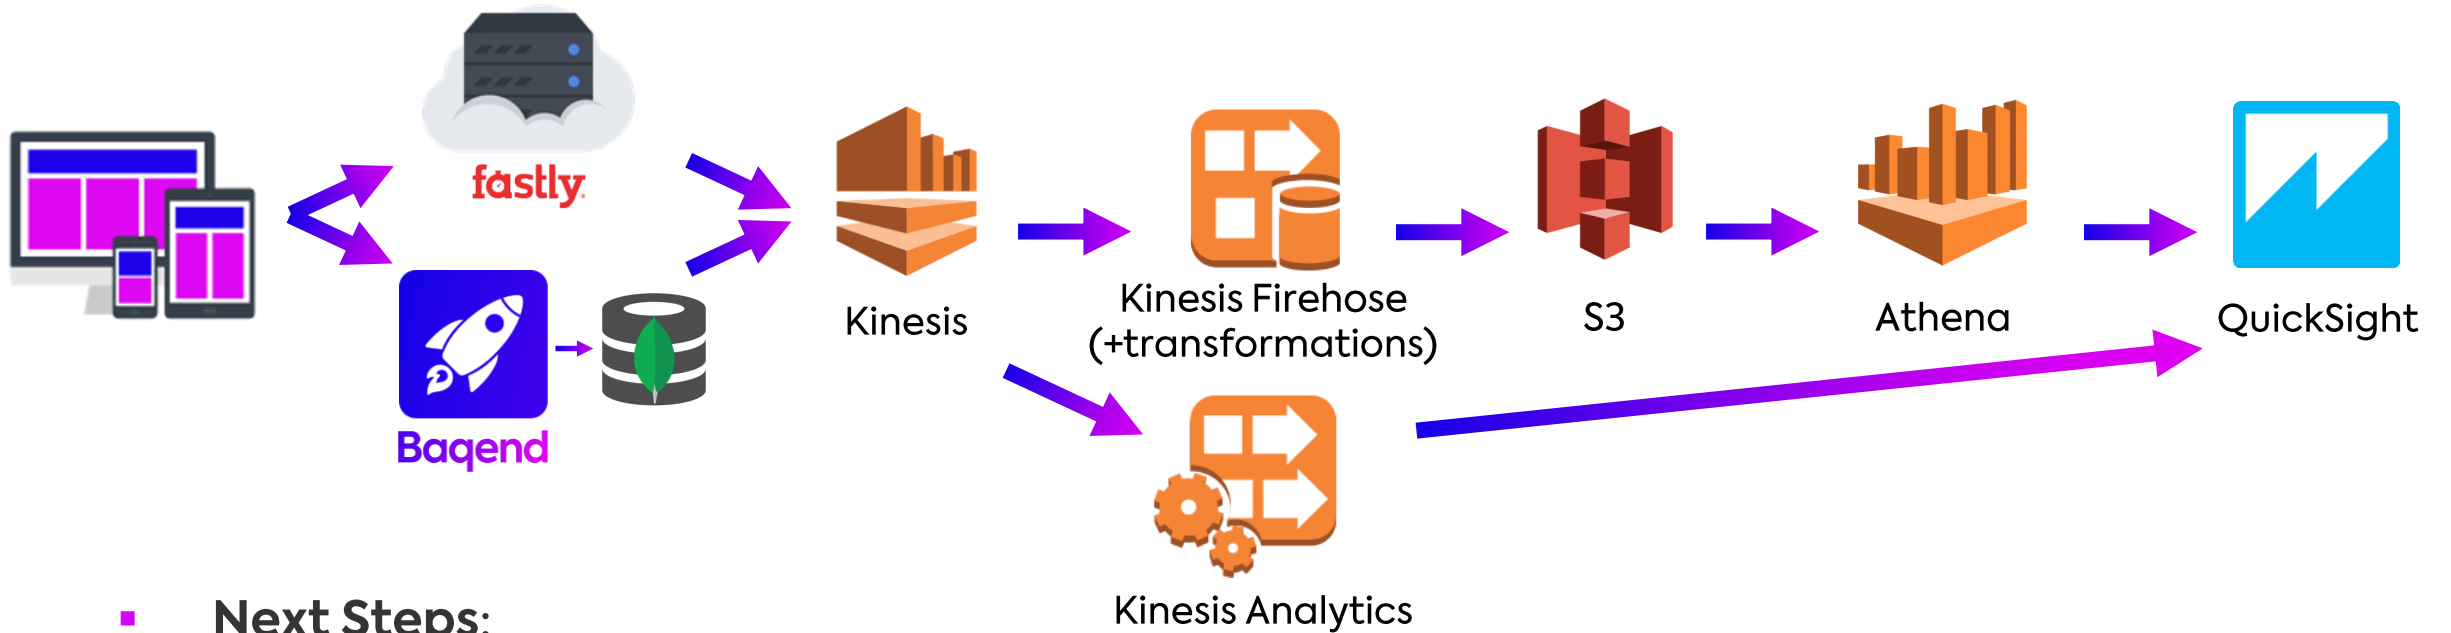

Implicit Query Rewriting in QuickSight

Hard to predict, hard to circumvent, hardly helpful

A person with long hair is seen from behind, looking out at a port at night. The port is filled with large cranes and ships, with lights reflecting on the water. The scene is bathed in a purple and blue light.

Outlook

Real-Time Analytics & Reporting

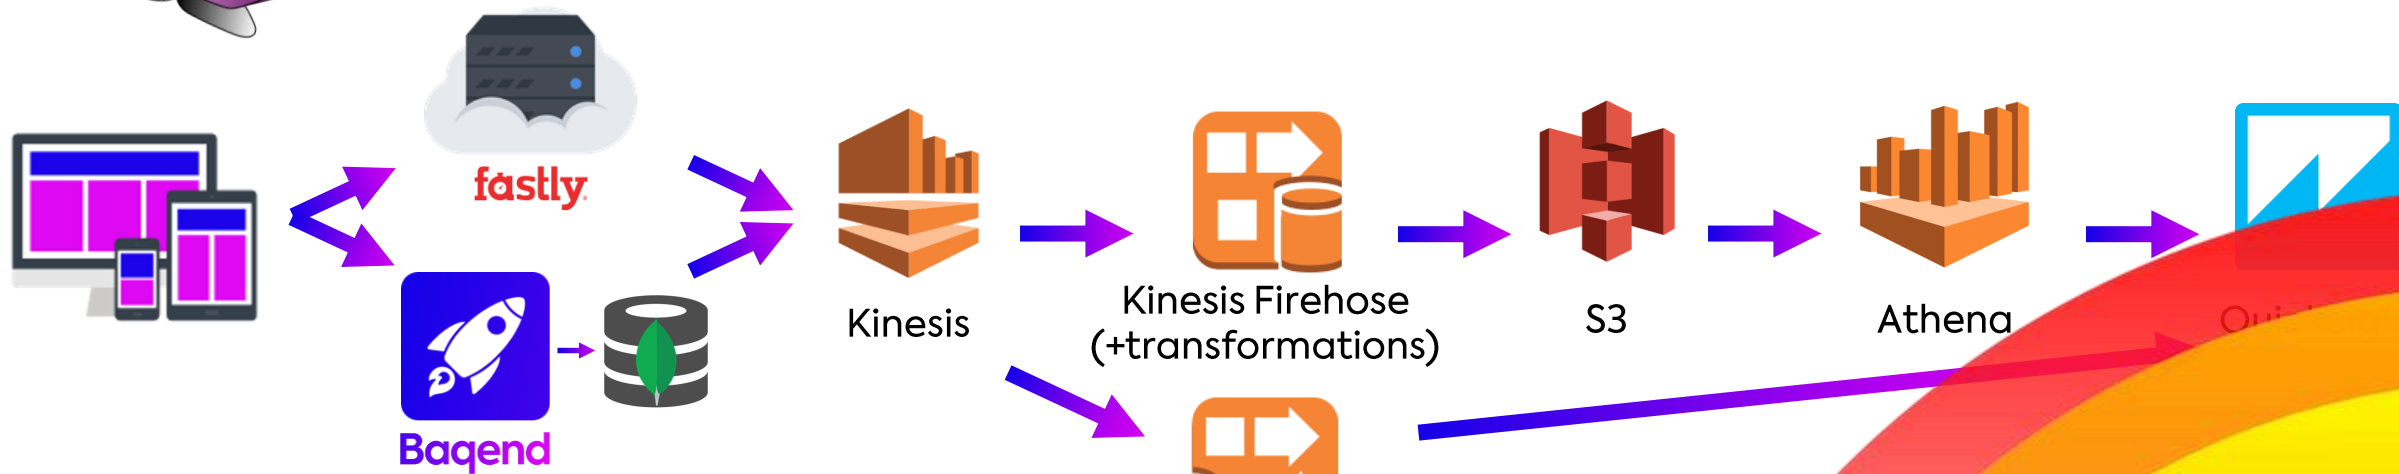

- **Next Steps:**

- Continuous ingestion
- Streaming analytics & real-time dashboards
- Drop QuickSight
